	BDD or behavior-driven development, in which an application is specified and
	designed by describing how it behaves. BDD offers the ability to enlarge the pool
	of input and feedback to include business stakeholders and end users like Scrum
	Master, Product Owner, Business Analyst etc., who may not even have software
BDD	development knowledge.
	Software tool based on Behavior Driven Development (BDD) framework which is
	used to write acceptance tests for the web application. The tests are written in
	easily readable and understandable format for Business Analysts, Developers and
Cucumber	Testers.
	Shifting from thinking in "tests" to thinking in "behavior"
	Collaboration between Business stakeholders, Business Analysts, QA Team and
	developers
	Driven by Business Value
	Extends Test-Driven Development (TDD) by utilizing natural language that non-
	technical stakeholders can understand
	BDD frameworks such as Cucumber or JBehave are an enabler, acting a "bridge"
	between Business & Technical Language
	BDD is popular and can be utilized for Unit level test cases and for UI level test
Features of BDD	cases.
	The Feature keyword's aim is to collect relevant scenarios and provide a high-
Feature	level description of a software feature.
	The scenarios are written based on the expected behavior of the software and it
Scenario	is tested to check if it matches said scenarios.
Step	Each line in a scenario is called a step
Given	Describes the initial steps of pre-condition before the start of a test
When	Describes user actions during a test or steps performed
Then	Describes test results or outcome from When actions
	Between any two statements, it gives the logical AND condition. AND can be
And	combined with the GIVEN, WHEN, and THEN statements
/ ind	It denotes a logical OR relationship between two propositions. OR can be
But	combined with the GIVEN, WHEN, and THEN statements
Dut	The Background section describes any common context to be established before
Background	each scenario.
Dackground	Cucumber scenarios become automated tests with the addition of what are
	called step definitions. A step definition is a block of code associated with one or
Step Definitions	more steps by a regular expression
Step Demittions	Infore steps by a regular expression
Evamplo	This is a practical illustration of a business rule. It comprises a series of steps.
Example	The scenario outline is similar to scenario, with the exception that several inputs
Scanario Outlina	
Scenario Outline	are provided.
	Tags in cucumber provide a way to run scenarios in a specific sequence from a
	runner file. Each situation can be labeled with a useful tag. Later, in the runner
	file, user may specify which tag (and hence which scenario(s)) Cucumber should
	run. "@" is the first character in a tag. Any relevant content after "@" can be
	used to define your tag.
tags	Example - "@SmokeTest"

	Hooks are code blocks that execute before or after each Cucumber scenario in
	the execution cycle. This enables us to better control the development workflow
	and decrease code redundancy. Setting up the web driver and terminating the
	web driver session resembles a test setup. The methods @Before and @After can
	be used to define hooks anywhere in the project or step definition layers. Before
	hook is executed before any other test situations, and after the hook is executed
hooks	after all test scenarios have been completed.
HOOKS	It has plain text descriptions of single or numerous test situations. Keywords like
	· · · · · · · · · · · · · · · · · · ·
	Then, When, Background, Scenario Outline, Feature, And, But, and so on are used
	in the tests. As a result, it's a file that keeps track of features and their
Feature File	descriptions.
	It essentially acts as a translator between the test scenario steps provided in the
	feature file and the automation code. Cucumber searches the step definition file
	and executes the relevant functions that are assigned to that step when it runs a
Step Definition File	step described in the feature file.
	It connects the feature file and the step definition file. It allows the user to run
	one or more feature files at the same time. It contains the locations of the step
TestRunner	definition and feature files
	Step 1: Download and install the Java platform on user machine
	Step 2: Download and install Eclipse IDE
	Step 3: Download Cucumber Eclipse Plugin:
	a. In the eclipse, navigate to Help > Install New Software. Copy the URL
	"http://cucumber.github.io/cucumber-eclipse/update-site/" and press Enter.
	b. User would see a checkbox named "Cucumber Eclipse Plugin", Select the
	checkbox 'Cucumber Eclipse Plugin'.
	c. Click 'Next'
	d. Again click 'Next' and Accept the license terms.
	e. Click Finish
	f. Click 'Install anyway'
	g. Click 'Restart Now'
	Step 4: Create a Maven Project in Eclipse
	Step 5: Open the pom.xml file in eclipse and the below dependency after
	navigating to Maven Repository "https://mvnrepository.com/"
	a. cucumber-java
Prerequisite required	•
for using Cucumber	c. cucumber-junit

```
<dependency>
                       <groupId>io.cucumber
                       <artifactId>cucumber-core</artifactId>
                       <version>7.0.0</version>
                     </dependency>
                           <dependency>
                      <groupId>io.cucumber
                      <artifactId>cucumber-java</artifactId>
                      <version>7.0.0</version>
                     </dependency>
                         <dependency>
                      <groupId>io.cucumber
                      <artifactId>cucumber-junit</artifactId>
                       <version>7.0.0</version>
Cucumber Maven
                       <scope>test</scope>
Dependency
                     </dependency>
                     Feature: Search in Google Home Page
                      Scenario: Search Cucumber Tutorial
                      Given Google Page open
                      And Search Text Box should be present in the Google Home Page
                      When User Search a Course with keyword Cucumber Tutorial
                      And Hit Enter Button
Sample Feature File
                      Then All Courses related to Cucumber Tutorial should be displayed
                     public class GoogleSearchEngine {
                     @Given("Google Page open")
                     Public void google_page_open() {
                     @Given("Search Text Box should be present in the Google Home Page")
                     public void search_text_box_should_be_present_in_the_google_home_page() {
                     ? 🏿
                     When("User Search a Course with keyword Cucumber Tutorial")
                    public void user_search_a_course_with_keyword_cucumber_tutorial() {
                     ? 1
                     When("Hit Enter Button")
                    @ublic void hit_enter_button() {
                     ? [2]
                    Then("All Courses related to Cucumber Tutorial should be displayed")
Sample Step
                    public void all_courses_related_to_cucumber_tutorial_should_be_displayed() {
Definitions Class
                     ? 🏿
```

```
@RunWith(Cucumber.class)
                      @CucumberOptions(
                     teatures = ("src/test/java/Features"),
                     glue = ("StepDefinitions"),
                     plugin = ("pretty"),
                      monochrome = true
                     public class Runner {
Sample Runner Class
                      @Before Hook: It will execute before every scenario. Example
                     @Before
                      public void setUp() {
                         System.out.println("Starting the test");
                      @After Hook: It will execute after every scenario.
                      @After
                     Public void tearDown () {
Sample Cucumber
                           System.out.println("Closing the test");
Hooks
                      Feature: Facebook Login
                     Scenario Outline: To check the login functionality for the facebook site
                       Given User Navigates to the Facebook Login Page
                       When User Enter <username> as UserName and <password> as Password
                       Then Login should be <status> for Facebook
                       Examples:
                        | username | password | status
                        | username1 | password1 | Successful |
Sample Scenario
                         | username1 | password2 | Unsuccessful |
Outline Example
                         | username2 | password3 | Unsuccessful |
                      Feature: Search in Google Home Page
                      Background:
                       Given Google Home Page Open
                       And Search Text Box is visible and Enabled
                      @Smoke @Regression
                      Scenario: Search Cucumber Tutorial in Google Home Page
                       When User Search a Course with Keyword Cucumber Tutorial
                       And Hit Enter
                       Then All Courses related to Cucumber Tutorial should be displayed
                      @Regression @Integration
                      Scenario: Search Java Tutorial in Google Home Page
                       When User Search a Course with Keyword Java Tutorial
                       And Hit Enter
Sample Cucumber
                       Then All Courses related to Java Tutorial should be displayed
